

Abstract

A turf cover apparatus for covering a ground surface that includes two separate and distinctly constructed covers fastened together. At least one insulating layer is disposed and secured between the two covers. A first cover is structured and
5 configured of a mesh material that allows air circulation to reach the ground surface. The second cover is structured and configured of a substantially chemical and moisture resistant material so as to protect the ground surface. The insulating layer is structured and configured of an organic material that enables control of air circulation and prevents entry of moisture to the ground surface.
